# Neural Network Embedding of the Over-Dispersed Poisson Reserving Model 

Andrea Gabrielli<br>RiskLab<br>ETH Zürich

Schweizerische Aktuarvereinigung SAV 110. Mitgliederversammlung

Luzern<br>30. August 2019

## Idea

- CANN (Combined Actuarial Neural Network) approach
- Embedding of cross-classified over-dispersed Poisson (ccODP) reserving model into neural network architecture
- Starting point of neural network calibration: ccODP model
$\Longrightarrow$ Learning model structure beyond ccODP model (boosting)

## Example Data

- Simulated from Individual Claims History Simulation Machine
- $1 \leq i \leq I$ : accident years, $0 \leq j \leq J$ : development delays
- Aggregated (incremental) payments $Y_{i, j}$ for all claims in LoB 1:

| Accident year $i$ | Development delay $j$ |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 |
| 1 | 9'416 | 4'850 | 1'596 | 871 | 594 | 446 | 322 | 242 | 188 | 177 | 159 | 130 |
| 2 | 9'822 | 5'293 | 1'826 | 1'026 | 657 | 457 | 364 | 292 | 228 | 191 | 146 |  |
| 3 | 9'613 | 4'903 | 1'665 | 970 | 594 | 443 | 325 | 263 | 212 | 176 |  |  |
| 4 | 9'788 | 5'250 | 1'823 | 1'086 | 744 | 550 | 431 | 303 | 226 |  |  |  |
| 5 | 9'955 | 5'722 | 2'089 | 1'159 | 791 | 558 | 458 | 354 |  |  |  |  |
| 6 | 10'453 | 6'122 | 2'214 | 1'311 | 859 | 630 | 497 |  |  |  |  |  |
| 7 | 11'130 | 6'476 | 2'401 | 1'356 | 890 | 677 |  |  |  |  |  |  |
| 8 | 11'268 | 6'629 | 2'504 | 1'493 | 1'008 |  |  |  |  |  |  |  |
| 9 | 11'475 | 6'953 | 2'648 | 1'478 |  |  |  |  |  |  |  |  |
| 10 | 12'172 | 7'084 | 2'746 |  |  |  |  |  |  |  |  |  |
| 11 | 12'816 | 8'028 |  |  |  |  |  |  |  |  |  |  |
| 12 | 13'239 |  |  |  |  |  |  |  |  |  |  |  |

## Cross-Classified Over-Dispersed Poisson (ccODP) Model

- ODP model: $Y_{i, j} / \phi \stackrel{\text { ind. }}{\sim} \operatorname{Poi}\left(\mu_{i, j} / \phi\right), \quad \phi>0$
- Cross-classification: $\log \mu_{i, j}=\alpha_{i}+\beta_{j}$
$\Longrightarrow \mathbb{E}\left[Y_{i, j}\right]=\operatorname{Var}\left(Y_{i, j}\right) / \phi=\mu_{i, j}=\exp \left\{\alpha_{i}+\beta_{j}\right\}$

## Cross-Classified Over-Dispersed Poisson (ccODP) Model

- ODP model: $Y_{i, j} / \phi \stackrel{\text { ind. }}{\sim} \operatorname{Poi}\left(\mu_{i, j} / \phi\right), \quad \phi>0$
- Cross-classification: $\log \mu_{i, j}=\alpha_{i}+\beta_{j}$
$\Longrightarrow \mathbb{E}\left[Y_{i, j}\right]=\operatorname{Var}\left(Y_{i, j}\right) / \phi=\mu_{i, j}=\exp \left\{\alpha_{i}+\beta_{j}\right\}$
- Minimize Poisson deviance statistics $\Longrightarrow \operatorname{MLEs}\left(\widehat{\alpha}_{i}\right)_{i},\left(\widehat{\beta}_{j}\right)_{j}$
- Estimates: $\widehat{Y}_{i, j}^{\mathrm{ODP}}=\widehat{\mu}_{i, j}^{\mathrm{ODP}}=\exp \left\{\widehat{\alpha}_{i}+\widehat{\beta}_{j}\right\}$
- ODP reserves $=\sum_{i+j>1} \widehat{\mu}_{i, j}^{\mathrm{ODP}}=$ Chain-ladder (CL) reserves

## Results

- Question: Can we do better?
$\Longrightarrow$ Embed ccODP model into neural network architecture

## ccODP Model as Neural Network

- Input layer: $(i, j) \in\{1, \ldots, I\} \times\{0, \ldots, J\}$
- Embedding layers:

$$
\begin{array}{ll}
\alpha(\cdot):\{1, \ldots, l\} \rightarrow \mathbb{R}, & \\
i \mapsto \alpha(i)=\widehat{\alpha}_{i}, \\
\beta(\cdot):\{0, \ldots, J\} \rightarrow \mathbb{R}, & \\
j \mapsto \beta(j)=\widehat{\beta}_{j} .
\end{array}
$$

- ccODP: $\widehat{\mu}_{i, j}^{\text {ODP }}=\exp \left\{\widehat{\alpha}_{i}+\widehat{\beta}_{j}\right\}$

## Neural Network Embedding (1/3)

- Neural network: (non-linear) parametric regression function
- Input layer: $(i, j) \in\{1, \ldots, I\} \times\{0, \ldots, J\}$
- Embedding layers: $(i, j) \mapsto\left(\widehat{\alpha}_{i}, \widehat{\beta}_{j}\right)$

## Neural Network Embedding (2/3)

- Three hidden layers with $\left(q_{1}, q_{2}, q_{3}\right)=(20,15,10)$
- First hidden layer: $z^{(1)}=\left(z_{1}^{(1)}, \ldots, z_{q_{1}}^{(1)}\right) \in \mathbb{R}^{q_{1}}$, where

$$
z_{l}^{(1)}=\tanh \left(b_{l}^{(1)}+w_{l, 1}^{(1)} \widehat{\alpha}_{i}+w_{l, 2}^{(1)} \widehat{\beta}_{j}\right) \in(-1,1)
$$

## Neural Network Embedding (3/3)

- Second hidden layer: $\boldsymbol{z}^{(2)}=\left(z_{1}^{(2)}, \ldots, z_{q_{2}}^{(2)}\right) \in \mathbb{R}^{q_{2}}$, where

$$
z_{l}^{(2)}=\tanh \left(b_{l}^{(2)}+\left\langle\boldsymbol{w}_{l}^{(2)}, z^{(1)}\right\rangle\right)
$$

- Third hidden layer: $\boldsymbol{z}^{(3)} \in \mathbb{R}^{q_{3}}$

## Blended Cross-Classified Neural Network (bCCNN)

- Output: $\mu_{i, j}^{\mathrm{bCCNN}}=\exp \left\{\quad b+\left\langle\boldsymbol{w}, \boldsymbol{z}^{(3)}(i, j)\right\rangle\right\}$

## Blended Cross-Classified Neural Network (bCCNN)

- Output: $\mu_{i, j}^{\mathrm{bCCNN}}=\exp \left\{\widehat{\alpha}_{i}+\widehat{\beta}_{j}+b+\left\langle\boldsymbol{w}, \boldsymbol{z}^{(3)}(i, j)\right\rangle\right\}$

## Blended Cross-Classified Neural Network (bCCNN)

- Output: $\mu_{i, j}^{\mathrm{bCCNN}}=\exp \left\{\widehat{\alpha}_{i}+\widehat{\beta}_{j}+b+\left\langle\boldsymbol{w}, \boldsymbol{z}^{(3)}(i, j)\right\rangle\right\}$
- Initialization: $b=0, \boldsymbol{w}=\mathbf{0} \Longrightarrow \mu_{i, j}^{\mathrm{bCCNN}}=\exp \left\{\widehat{\alpha}_{i}+\widehat{\beta}_{j}\right\}=\widehat{\mu}_{i, j}^{\mathrm{ODP}}$
$\Longrightarrow$ Starting point of neural network calibration: ccODP model

## Neural Network Calibration

- Neural network parameter: $\boldsymbol{\theta} \in \mathbb{R}^{q}$ with $q=547$
- Minimize Poisson deviance statistics $\mathcal{L}(\boldsymbol{\theta})$ with gradient descent:

$$
\boldsymbol{\theta} \leftarrow \boldsymbol{\theta}-\rho \nabla_{\boldsymbol{\theta}} \mathcal{L}(\boldsymbol{\theta}), \quad \rho>0
$$

## Neural Network Calibration

- Neural network parameter: $\boldsymbol{\theta} \in \mathbb{R}^{q}$ with $q=547$
- Minimize Poisson deviance statistics $\mathcal{L}(\boldsymbol{\theta})$ with gradient descent:

$$
\boldsymbol{\theta} \leftarrow \boldsymbol{\theta}-\rho \nabla_{\boldsymbol{\theta}} \mathcal{L}(\boldsymbol{\theta}), \quad \rho>0
$$

- Problem: For how long should we run gradient descent?
- Idea: Split claims
$\Longrightarrow$ training triangle and validation triangle

## Neural Network Calibration

- Neural network parameter: $\boldsymbol{\theta} \in \mathbb{R}^{q}$ with $q=547$
- Minimize Poisson deviance statistics $\mathcal{L}(\boldsymbol{\theta})$ with gradient descent:

$$
\boldsymbol{\theta} \leftarrow \boldsymbol{\theta}-\rho \nabla_{\boldsymbol{\theta}} \mathcal{L}(\boldsymbol{\theta}), \quad \rho>0
$$

- Problem: For how long should we run gradient descent?
- Idea: Split claims
$\Longrightarrow$ training triangle and validation triangle

## Multiple LoB Model

- Input layer: $(i, j, m) \in\{1, \ldots, I\} \times\{0, \ldots, J\} \times\{1, \ldots, 6\}$
- Embedding layers:

$$
\begin{aligned}
\alpha(\cdot):\{1, \ldots, l\} \rightarrow \mathbb{R}^{6}, & i \mapsto \alpha(i)=\left(\widehat{\alpha}_{i \mid 1}, \ldots, \widehat{\alpha}_{i \mid 6}\right), \\
\beta(\cdot):\{0, \ldots, J\} \rightarrow \mathbb{R}^{6}, & j \mapsto \beta(j)=\left(\widehat{\beta}_{i \mid 1}, \ldots, \widehat{\beta}_{i \mid 6}\right), \\
\gamma(\cdot):\{1, \ldots, \sigma\} \rightarrow \mathbb{R}, & m \mapsto \gamma(m)=\gamma_{m} .
\end{aligned}
$$

- Output: $\mu_{i, j, m}^{\mathrm{LoB}}=\exp \left\{\widehat{\alpha}_{i \mid m}+\widehat{\beta}_{j \mid m}+b+\left\langle\boldsymbol{w}, \boldsymbol{z}^{(3)}(i, j, m)\right\rangle\right\}$

## Relative Model Differences

- For each cell $(i, j)$ :

$$
\frac{\widehat{\mu}_{i, j,}^{\mathrm{LOB}}-\widehat{\mu}_{i, j}^{\mathrm{ODP}}}{\widehat{\mu}_{i, j}^{\mathrm{ODP}}}
$$

## Relative Model Differences

- For each cell $(i, j)$ :

$\Longrightarrow$ slower payout pattern in more recent accident years

## Cumulative Development Factors

- ccODP model:

$$
\begin{aligned}
f_{j}^{\mathrm{ODP}} & =\frac{\sum_{l=0}^{j} \widehat{\mu}_{i, l}^{\mathrm{ODP}}}{\widehat{\mu}_{i, 0}^{\mathrm{ODP}}} \\
& =\frac{\sum_{l=0}^{j} \exp \left\{\widehat{\beta}_{l}\right\}}{\exp \left\{\widehat{\beta}_{0}\right\}}
\end{aligned}
$$

- Multiple LoB model:

$$
f_{i, j}^{\mathrm{LoB}}=\frac{\sum_{l=0}^{j} \widehat{\mu}_{i, l, \cdot}^{\mathrm{LoB}}}{\widehat{\mu}_{i, 0, \cdot}^{\mathrm{LoB}}}
$$

## Cumulative Development Factors

- ccODP model:

$$
\begin{aligned}
f_{j}^{\mathrm{ODP}} & =\frac{\sum_{l=0}^{j} \widehat{\mu}_{i, l}^{\mathrm{ODP}}}{\widehat{\mu}_{i, 0}^{\mathrm{ODP}}} \\
& =\frac{\sum_{l=0}^{j} \exp \left\{\widehat{\beta}_{l}\right\}}{\exp \left\{\widehat{\beta}_{0}\right\}}
\end{aligned}
$$

- Multiple LoB model:

$$
f_{i, j}^{\mathrm{LoB}}=\frac{\sum_{l=0}^{j} \widehat{\mu}_{i, l, \cdot}^{\mathrm{LoB}}}{\widehat{\mu}_{i, 0, \cdot}^{\mathrm{LoB}}}
$$

$\Longrightarrow$ accident year dependent cumulative development factors

## Bias (100 Datasets)

- bCCNN model
- multiple LoB model
reserves over different seeds of LoB 1

$\Longrightarrow$ learning additional model structure

## Conclusions

- Learning additional model structure through embedding
- Number of training iterations has to be chosen carefully
- Small number of iterations allows us to apply bootstrap
- Extension: embedding of numbers of claims and payments
